IdeoLogic Flash Programmer Software

The Flash Programmer Software is a software tool for in-circuit programming of flash memory devices using the BDM port found on the 683XX and 68HC16 Motorola MCUs. This product works in conjunction with any of the Nohau 683XX and 68HC16 emulators. The Nohau product EMUL16/300 or BDM16/300 is required.

The Flash Programmer Software includes a DOS-based executable and target-based programming algorithms for all supported flash devices. Provided with the software are a user's manual, which describes the methodology and configuration of the tool, and example configurations and batch files. The Nohau emulator provides the MCU BDM-to-PC interface. This product works under DOS, MS Windows 3.1/3.11 and Windows 95. Call for Windows NT availability.

IdeoLogic Flash Programmer System

The Flash Programmer System is a complete system for in-circuit programming of flash memory devices using the BDM port found on the 683XX and the 68HC16 Motorola MCUs. This product includes both the Flash Programmer software and the IdeoLogic SmartPort parallel port-to-BDM interface module. A Nohau emulator is NOT required but can optionally be used in place of the SmartPort to provide the BDM-to-PC interface.

IdeoLogic: Flash Pricing Guide

The Flash Programmer software package includes a DOS-based executable and target-based programming algorithms for all supported flash devices. Provided with the software is a user's manual, which describes the methodology and configuration of the tool, and example configurations and batch files. Either the included IdeoLogic SmartPort or a Nohau emulator can provide the BDM-to-PC interface. This product works under DOS, MS Windows 3.1/3.11 and Windows 95. Call for Windows NT availability.

This product is particularly suited to production and field service environments where the user does not have or require target debug capability. Flash programming speed is very fast when using the SmartPort interface.

Domestic:
